

Phase 1 – Brainstorming & Ideation

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Introduction

Educational institutions store sensitive information such as student roll numbers, branch details, faculty information, email addresses, and phone numbers. This information should be accessible only to authorized users. ServiceNow provides Access Control Lists (ACLs) to protect records by checking user roles and record conditions before granting access.

This project demonstrates how to implement a Script-Controlled ACL that allows only authorized users to access records belonging to the EEE branch, while administrators retain full access to all records.

2. Problem Statement

In many organizations, all users should not have permission to view or modify every record. Without proper security, confidential student information can be accessed by unauthorized users.

The problem addressed in this project is to restrict record access based on both the Branch field value and user roles, ensuring that only eligible users can perform specific operations.

3. Project Idea

The project involves creating a custom table named Institution Details and configuring multiple ACLs for Read, Create, Write, and Delete operations. JavaScript scripting is used inside the Read ACL to check whether the logged-in user has the required role before allowing access.

4. Objectives

- Create a test user in ServiceNow.
- Create custom roles (bb1, bb2, bb3, bb4).
- Build the Institution Details custom table.
- Add student-related fields to the table.
- Configure Script-Controlled Read ACL.
- Configure Create, Write, and Delete ACLs.
- Test the security using impersonation.

5. Existing System

In an unsecured system:

- Any user may access sensitive records.
- Data privacy is not maintained.
- Unauthorized users may edit or delete information.

6. Proposed Solution

The proposed solution combines Role-Based Access Control (RBAC) with Script-Controlled ACLs. The system checks whether the logged-in user has the required role before granting access.

Access Rules

User	Access
Admin	Full access
bb1	View EEE records
bb2	Create records
bb3	Edit records
bb4	Delete records

7. Expected Benefits

- Protects sensitive student records.
- Prevents unauthorized access.
- Improves data security.
- Demonstrates practical implementation of ServiceNow ACLs.
- Supports secure record management.

8. Expected Outcome

After completing the project, the Institution Details application will successfully enforce record-level security. Administrators will have full control, users with bb1 will view only EEE records, and additional roles will control Create, Write, and Delete permissions, making the application secure and compliant with role-based access requirements.
